#### I. Question 11.9.5 (18)

If a and b are the roots of  $x^2 - 3x + p = 0$  and c, d are roots of  $x^2 - 12x + q = 0$  where a, b, c, dform a G.P. Prove that (q + p) : (q - p) = 17:15.

### II. SOLUTION

Parameter	Value	Description
$x_1(n)$	-	G.P. Sequence
$x_1(0)$	а	First term of G.P.
$x_1(1)$	b	Second term of G.P.
$x_1(2)$	c	Third term of G.P.
$x_1(3)$	d	Fourth term of G.P.
r	$\frac{b}{a}$	Common ratio

GIVEN PARAMETERS

TABLE 1

Given  $x_1(0)$  and  $x_1(1)$  are the roots of  $x^2-3x+p=$ 0 So, we have:

$$a + b = 3 \tag{1}$$

$$ab = p \tag{2}$$

Also,  $x_1(2)$  and  $x_1(3)$  are the roots of  $x^2-12x+q=$ 0 , so,

$$c + d = 12 \tag{3}$$

(4)

$$cd = q$$

From (1) and (3), we get,

$$a(1+r) = 3 \tag{5}$$

$$ar^2(1+r) = 12 (6)$$

On dividing eq. (5) and eq. (6), we get

$$\frac{ar^2(1+r)}{a(1+r)} = \frac{12}{3} \tag{7}$$

$$r^2 = 4 \tag{8}$$

$$r = \pm 2 \tag{9}$$

When r = 2, a = 1When r = -2, a = -3

Case 1: When r = 2 and a = 1

$$p = ab \tag{10}$$

$$p = 2 \tag{11}$$

$$q = cd \tag{12}$$

$$q = 32 \tag{13}$$

$$\frac{q+p}{q-p} = \frac{32+2}{32-2} \tag{14}$$

$$=\frac{17}{15}$$
 (15)

Case 2: When r = -2 and a = -3

$$p = ab \tag{16}$$

$$p = -18 \tag{17}$$

$$q = cd \tag{18}$$

$$q = 288 \tag{19}$$

$$\frac{q+p}{q-p} = \frac{288-18}{288+18} \tag{20}$$

$$=\frac{135}{153}$$
 (21)

$$x_1(n) \longleftrightarrow X(z)$$

$$ar^n u(n) \longleftrightarrow \frac{a}{1 - rz^{-1}} ; |z| > |r|$$
 (22)

$$ar^n u(n) \longleftrightarrow \frac{z}{1 - rz^{-1}} \; ; \; |z| > |r|$$
 (22)

$$\therefore X(z) = \frac{1}{1 - 2z^{-1}} \; ; \; (|z| > 2) \tag{23}$$
